This strain is a derivative of RR1 that has been made lan–. The lan mutation knocks out the major ATP-dependent protease in the E. coli cytoplasm, thus improving the stability of many foreign proteins when expressed in E. coli. The maIE gene, which encodes Maltose-Binding Protein, is deleted as part of the maIB deletion.

Notes: Storage at –70°C is recommended for periods longer than 30 days. Avoid repeated freeze/thaw cycles.

This strain replaces PR745. It is fhuA2.
