promotes the strand exchange of single-strand DNA. The reaction has three distinct steps: (i) RecA polymerizes on the single-strand DNA, (ii) the nucleoprotein filament binds the duplex DNA and searches for a homologous region, (iii) the strands are exchanged (2). Source: RecA is expressed as a N-terminal 6X His tag recombinant protein from a plasmid in E. coli strain ER3010 which encodes a full-length 353 amino acids wild type E. coli RecA protein. Supplied in: 0.1 mM EDTA, 10 mM Tris-HCl (pH 7.5 @ 25°C), 1 mM DTT and 50% glycerol.

Reagents Supplied with Enzyme:
- 1X RecA Reaction Buffer.
- ATPγS which is required for triple helix formation is not supplied.

Reaction Conditions:
- 1X RecA Reaction Buffer. Incubate at 37°C.

1X RecA Reaction Buffer:
- 70 mM Tris-HCl
- 10 mM MgCl2
- 5 mM dithiothreitol
- pH 7.5 @ 25°C

Unit Definition: Protein concentration is determined by the Pace method (12) using extinction coefficient of 21,555 for recA.

Molecular Weight: 38,796 daltons.

Heat Inactivation: 65°C for 20 minutes.

Quality Assurance: Each lot is tested for its ability to form a stable triple helix and is visually determined to be > 99% pure on an SDS-polyacrylamide gel.

Quality Control Assays
- Exonuclease Activity: A 50 µl reaction in RecA Reaction Buffer containing 1 µg of a mixture of single and double-stranded [3H] E. coli DNA and 10 µg of RecAf incubated for 4 hours at 37°C results in < 10% conversion to the nicked form as determined by agarose gel electrophoresis.
- Endonuclease Activity: A 50 µl reaction in RecA Reaction Buffer containing 1 µg of supercoiled φX174 RF I DNA and 10 µg of RecAf incubated for 4 hours at 37°C results in < 10% conversion to the nicked form as determined by agarose gel electrophoresis.
- Non-specific Nuclease Assay: A 50 µl reaction in RecA Reaction Buffer containing 40 ng of labeled RNA and 10 µg of RecAf is incubated at 37°C. After incubation for 16 hours, > 90% of the substrate RNA remains intact as determined by agarose gel electrophoresis.
- RNase Assay: A 50 µl reaction in RecA Reaction Buffer containing 40 ng of labeled RNA and 10 µg of RecAf is incubated at 37°C. After incubation for 16 hours, > 90% of the substrate RNA remains intact as determined by agarose gel electrophoresis.

(see other side)
RecA Functional Assay:
The plasmid pUC19 contains 5 HpyCH4IV sites. A 60 mer was designed with complementarity to the region centered around the HpyCH4IV site at position 374. A reaction containing 1 μg pUC19, 0.18 μg 60 mer, 0.3 mM ATP γ-S, 4 μg RecA, in 40 μl 1X RecA Reaction Buffer was incubated at 37°C for 10 minutes to form a stable triple helix. The unprotected sites were methylated using 8 units of SssI supplemented with 160 μM SAM for 10 minutes at 37°C. The reaction was stopped and the triple helix was disrupted by incubation at 65°C for 15 minutes. The reaction was cooled and 10 units of HpyCH4IV were added followed by digestion at 37°C for 20 minutes. > 95% of the product is single cut pUC19.
