CERTIFICATE OF ANALYSIS

Endo F₁, F₂, H:
Dansylated invertase high mannose. ND

Endo F₂, F₃:
Dansylated fibrinogen biantennary. ND

Protease Assay: After incubation of 400 units of α 2-3 Neuraminidase S with 0.2 nmol of a standard mixture of proteins in a 20 μ l reaction, for 20 hours at 37°C, no proteolytic activity could be detected by SDS-PAGE.

Physical Purity: Purified to > 95% homogeneity as determined by SDS-PAGE analysis using Coomassie Blue detection.

Heat Inactivation: 75°C for 10 minutes.

Reaction Conditions: Optimal incubation times and enzyme concentrations must be determined empirically for a particular substrate. Typical reaction conditions are as follows:

1. Combine 1 μ g of glycoprotein or 100 nM of oligosaccharide and H₂O (if necessary) to make a 9 μ l total reaction volume.
2. Add 1 μ l of 10X GlycoBuffer 1 to make a 10 μ l total reaction volume.
3. Add 1 μ l of α 2-3 Neuraminidase S.
4. Incubate at 37°C for 1 hour.

Notes on Use:

- Reactions may be scaled-up linearly to accommodate larger reaction volumes.
- The amount of exoglycosidase enzyme required varies when different substrates are used. Start with 1–2 μ l for 1 μ g of glycoprotein or 100 nM of oligosaccharide for one hour in a 10–25 μ l reaction. If there is still undigested material, let the reaction go overnight.
